Dimer model on the disk

bipartite graph with weight : edges $\rightarrow \mathbb{R}_{>0}$ n := #boundary white vertices

Dimer covers

- A **dimer cover** *M* is a subset of the edges that uses each internal vertex exactly once and each boundary vertex at most once.
- The **boundary** ∂M of *M* is the subset of boundary white vertices not used by *M*.

 $k := #\partial M = #$ white vertices – #black vertices.

• The weight of *M* is the product of weights of edges in *M*.

Dimer partition functions

• For *I* a *k*-element subset of {1, 2, ..., *n*}, the **dimer partition function** is defined as

$$Z_I := \sum_{M: \partial M = I} \operatorname{weight}(M).$$

 $Z_{134} = acg + bdg$

[Postnikov, 2006] boundary measurement : weight \mapsto (Z_l)

Gauge transformations

 $Z_{134} = \lambda acg + \lambda bdg$

Multiplying the weights of all edges incident to an internal vertex by a constant $\lambda \in \mathbb{R}_{>0}$ rescales each Z_l by λ

Boundary measurement map [Postnikov, 2006]

- We identify weighted bipartite graphs if they are related by gauge transformations. So, we need to identify (Z_l) and (λZ_l).
- Projective space $\mathbb{RP}^{\binom{n}{k}-1} := \mathbb{R}^{\binom{n}{k}} \{0\}$ /scaling.

boundary measurement : weight/gauge $\mapsto (Z_l)$ /scaling $\subset \mathbb{RP}^{\binom{n}{k}-1}$.

Question: Which points in projective space arise from dimer models? [Postnikov, 2006] The totally nonnegative Grassmannian $\operatorname{Gr}_{\geq 0}(k, n)$.

The totally nonnegative Grassmannian

- The Grassmannian Gr(k, n) is the space of k-dimensional subspaces of \mathbb{R}^n .
- We can represent a point $V \in Gr(k, n)$ as the rowspan of a $k \times n$ matrix M of full rank.
- The k × k minors of M are (homogeneous) coordinates on Gr(k, n), called Plücker coordinates. Let ∆_I denote the Plücker coordinate using columns indexed by I, where I is a k-element subset of {1, 2, ..., n}. They give an embedding of Gr(k, n) in ℝP^{(n)/1}.

• If
$$V = \text{rowspan} \begin{bmatrix} 1 & a & 0 & -c \\ 0 & b & 1 & d \end{bmatrix}$$
, then the Plücker coordinates are

 $\Delta_{12} = b, \Delta_{13} = 1, \Delta_{14} = d, \Delta_{23} = a, \Delta_{24} = ad + bc, \Delta_{34} = c.$

The subset Gr_{≥0}(k, n) of Gr(k, n) where all Plücker coordinates are positive nonnegative is called the totally nonnegative Grassmannian. If a, b, c, d ≥ 0, then V ∈ Gr_{≥0}(2, 4).

Reduction moves [Postnikov, 2006]

• Each reduction move preserves the boundary measurement map.

ヘロト 人間 ト 人 ヨト 人 ヨト 二 ヨ

Dac

A graph is move-reduced if no reduction move can be applied.

Equivalence moves

- Both moves come with transformations of weights such that the boundary measurement is preserved.
- Two move-reduced graphs are called **move-equivalent** if they are related by moves.

Э

Dac

Positroid stratification [Postnikov, 2006]

- The totally nonnegative Grassmannian has a stratification into cells called **positroid cells**.
- For move-reduced graphs,

boundary measurement : weights/gauge \rightarrow positroid cell

is a homeomorphism.

Zig-zag paths

< ロ > < 目 > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Decorated permutation [Postnikov, 2006]

Reduced graphs and minimal graphs

A graph is called **reduced** if the following structures are absent (except for boundary leaves).

A (leafless) graph (with no isolated components) is called **minimal** if it has the fewest number of faces among all graphs with the same decorated permutation.

Theorem: [Postnikov, 2006 and Thurston, 2004]

Assume the graph has a dimer cover. Then,

move-reduced \iff reduced \iff minimal.

Classification of positroid cells

Theorem: [Postnikov, 2006] The following objects are in bijection:

- 1. Positroid cells in the totally nonnegative Grassmannian.
- 2. Move-equivalence classes of move-reduced graphs.
- 3. Decorated permutations.
- 4. Many more ...

Question: How to generalize these results to the dimer model on the torus.

A starting point is to classify move-equivalence classes of move-reduced graphs on the torus.

Newton polygon (analogous to decorated permutation)

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Reduced graphs on the torus

A graph on the torus is called **reduced** if in the corresponding biperiodic graph in the plane, the following structures are absent.

Theorem: [Goncharov–Kenyon, 2013]

Move-equivalence classes of reduced graphs are in bijection with convex polygons with integer vertices.

$\mathsf{Move}\text{-reduced} \Longrightarrow \mathsf{Reduced}$

We need to generalize the Newton polygon.

<ロ> < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Decorated polygons

[Galashin–G, 2022] In a move-reduced graph, parallel zig-zag paths do not intersect \implies Parallel zig-zag paths have a well-defined cyclic order.

Newton polygon + collection of cyclic compositions

cyclic composition = composition modulo cyclic shift (so (2,1,3,1) = (1,3,1,2), etc)

Minimal graphs

A (leafless) graph (with no contractible components) is called **minimal** if it has the fewest number of faces among all graphs with the same decorated polygon.

Theorem 1: [Galashin-G, 2022] Assume the graph has a dimer cover. Then,

 $\mathsf{reduced} \implies \mathsf{move-reduced} \Longleftrightarrow \mathsf{minimal}.$

The assumption that the graph has a dimer cover is essential. The following graph is move-reduced but not minimal.

Open problem: Is there a generalization of reduced that is equivalent to move-reduced?

However...

Both graphs have the same decorated Newton polygon, but are not move-equivalent since one of them is connected and the other one is not.

Main theorem

For a cyclic composition $\alpha = (\alpha_1, ..., \alpha_k)$ of *n*, let $rot(\alpha)$ be the smallest cyclic rotation that fixes α .

- rot(1, 1, 1, 1, 1, 1) = 1.
- rot(2, 1, 2, 1) = 3.
- rot(2, 2, 1, 1) = 6.

Let *d* denote the gcd of $rot(\alpha)$ as α varies over the cylic compositions associated to edges of the Newton polygon. For example, *d* = 2 for the following decorated polygon:

Theorem 2: [Galashin–G, 2022] For any decorated polygon, there are *d* move-equivalence classes of move-reduced graphs classified by their **modular invariant**.

Spectral transform

- The point in Gr_{≥0}(k, n) given by boundary measurement is the kernel of the Kasteleyn matrix K (= space of discrete holomorphic functions).
- On the torus, the Kasteleyn matrix *K* is a matrix of Laurent polynomials *K*(*z*, *w*).
- The map

spectral transform : weights/gauge \mapsto kernel of K(z, w)

was defined by [Kenyon-Okounkov, 2007].

Harnack curve + standard divisor

Spectral transform

Theorem: [Postnikov, 2006]

For move-reduced graphs,

boundary measurement : weights/gauge \rightarrow positroid cell

is a homeomorphism.

Theorem: [Kenyon–Okounkov, 2007]

For reduced graphs,

spectral transform : weights/gauge \rightarrow Harnack curves with given Newton polygon +

is a homeomorphism.

The explicit inverse appears in [Fock, 2015] for complex weights and [Boutillier–Cimasoni–de Tilière, 2023] for positive weights.
